✔ **Doctype** Doctype is the first line of the HTML document. It tells the browser which version of HTML the document is written in.

Doctype is the first line of the HTML document. It tells the browser which version of HTML the document is written in. The most common doctype is HTML5. It is important to have a doctype to ensure that the browser renders the page correctly. Without a doctype, the browser will use a default doctype, which may not be the one you want. The doctype also affects the layout of the page. For example, the HTML5 doctype is more flexible than the HTML4 doctype. It allows for more variation in the way that elements are used. This is why it is important to have a doctype at the top of every HTML document.

● **W3C Validity** W3C is the World Wide Web Consortium. It is the main international standards organization for the World Wide Web. It develops and maintains the standards that govern the Web, such as HTML, CSS, and JavaScript.

W3C is the World Wide Web Consortium. It is the main international standards organization for the World Wide Web. It develops and maintains the standards that govern the Web, such as HTML, CSS, and JavaScript. The W3C standards are used by web developers to create web pages that are compatible with all web browsers. This ensures that the web pages will look and work the same way on all devices. The W3C also provides tools and resources to help web developers create valid web pages. This includes the W3C Markup Validation Service, which checks HTML documents for errors. It also provides the W3C CSS Validation Service, which checks CSS documents for errors. These tools are essential for creating high-quality web pages that are compatible with all web browsers.

✔ **Encoding** Encoding is the process of converting data into a format that can be stored or transmitted. It is used to represent data in a way that is compatible with the system it is being used in.

Encoding is the process of converting data into a format that can be stored or transmitted. It is used to represent data in a way that is compatible with the system it is being used in. The most common encoding is UTF-8. It is a variable-length character encoding that can represent any character in the Unicode standard. UTF-8 is used by most web browsers and servers. It is important to use the correct encoding for your web pages. If you use the wrong encoding, the characters in your web pages may not display correctly. This is why it is important to specify the encoding at the top of every HTML document. The most common encoding is UTF-8.
