✔ **Doctype** Doctype is the first line of the HTML document. It tells the browser which version of HTML the document is written in.

Doctype is the first line of the HTML document. It tells the browser which version of HTML the document is written in. The most common doctype is HTML5. It is important to have a doctype to ensure that the browser renders the page correctly. Without a doctype, the browser will use a default doctype, which may not be the one you want. The doctype also affects the layout of the page. For example, the HTML5 doctype is more flexible than the HTML4 doctype. It allows for more variation in the way that elements are used. This is why it is important to have a doctype at the top of every HTML document.

● **W3C Validity** W3C is the World Wide Web Consortium. It is the main international standards organization for the World Wide Web. It develops and maintains the standards that govern the Web, such as HTML, CSS, and JavaScript.

W3C is the World Wide Web Consortium. It is the main international standards organization for the World Wide Web. It develops and maintains the standards that govern the Web, such as HTML, CSS, and JavaScript. The W3C standards are used by web developers to create websites that are compatible with all web browsers. This ensures that users can access the website regardless of which browser they are using. The W3C also provides tools and resources to help web developers create websites that are compliant with the standards. This includes the W3C Validator, which checks the code of a website for errors. It also provides a list of the latest standards and a glossary of the terms used in the standards. The W3C is a non-profit organization and its work is funded by the members of the consortium. The members are companies and organizations that are interested in the development of the Web. The W3C is a key organization in the development of the Web and its standards are essential for the success of the Web.

✔ **Encoding** Encoding is the process of converting data into a format that can be stored or transmitted. It is used to represent data in a way that is compatible with the system it is being used in. The most common encoding is UTF-8, which is used to represent text in a way that is compatible with all systems.

Encoding is the process of converting data into a format that can be stored or transmitted. It is used to represent data in a way that is compatible with the system it is being used in. The most common encoding is UTF-8, which is used to represent text in a way that is compatible with all systems. UTF-8 is a variable-length encoding, which means that it can represent any character in the Unicode standard. This makes it a very flexible encoding and it is the most widely used encoding for text on the Web. UTF-8 is also a backward-compatible encoding, which means that it can represent all the characters that were represented by the older encodings. This makes it a very easy encoding to use and it is the most widely used encoding for text on the Web.
