✔ **Doctype** Doctype is the first line of the HTML document. It tells the browser which version of HTML the document is written in.

Doctype is the first line of the HTML document. It tells the browser which version of HTML the document is written in. The most common doctype is HTML5. It is important to have a doctype to ensure that the browser renders the page correctly. Without a doctype, the browser will use a default doctype, which may not be the one you want. The doctype is written as a line of text at the top of the HTML file, before the <html> tag. The correct doctype for HTML5 is: <!doctype html>. This tells the browser that the document is written in HTML5. If you are using an older version of HTML, you will need to use a different doctype. For example, for HTML4.01, you would use: <!doctype html public "-//W3C//DTD HTML 4.01 Transitional//>. The doctype is case-insensitive, so you can write it in all caps, all lowercase, or a mix of both. It is also important to note that the doctype must be the first line of the document, with no spaces or other characters before it. If there are any characters before the doctype, the browser will not recognize it and will use a different doctype. So, make sure that the doctype is the first line of your HTML document, and that it is written correctly for the version of HTML you are using.

● **W3C Validity** W3C is the World Wide Web Consortium. It is an international community of experts who work together to develop standards for the Web. One of the standards they develop is the HTML specification. The W3C also provides tools to help developers check if their code is valid according to the HTML specification. These tools are called validators. There are two main types of validators: online and offline. Online validators are web-based and can be accessed from any computer with an internet connection. Offline validators are installed on your computer and can be used without an internet connection. Both types of validators can check if your code is valid according to the HTML specification. They can also provide suggestions for how to fix any errors that they find. Using a validator is a good practice for any web developer. It can help you catch errors early on, before they become a problem for your users. It can also help you learn more about the HTML specification and how to write better code. So, make sure to use a validator regularly to check your code and keep it valid according to the HTML specification.

It can help you catch errors early on, before they become a problem for your users. It can also help you learn more about the HTML specification and how to write better code. So, make sure to use a validator regularly to check your code and keep it valid according to the HTML specification.

✔ **Charset** Charset is a way of encoding text so that it can be stored and transmitted over the Internet. It is a standard that defines how the characters in a text file are represented by numbers. The most common charset is UTF-8. It is a variable-length character encoding that can represent any character in the Unicode standard. UTF-8 is also backward compatible with ASCII, which means that any text that was written in ASCII can still be read if it is encoded in UTF-8. This makes UTF-8 a very popular choice for web pages. Other common charsets include ISO-8859-1 and Windows-1252. These are single-byte character encodings that can only represent a limited range of characters. If you are using a charset that is not UTF-8, you will need to specify it in the HTML document. This is done by adding a meta tag to the head of the document. For example, to specify UTF-8, you would add: <meta charset="UTF-8">. If you are using a different charset, you would use a different value for the charset attribute. It is important to note that the charset must be specified in the HTML document, or the browser will use a default charset. This default charset may not be the one you want, so it is always best to specify the charset explicitly. So, make sure to specify the charset in your HTML document to ensure that your text is displayed correctly.

Charset is a way of encoding text so that it can be stored and transmitted over the Internet. It is a standard that defines how the characters in a text file are represented by numbers. The most common charset is UTF-8. It is a variable-length character encoding that can represent any character in the Unicode standard.
