✔ **Doctype** Doctype is the first line of the HTML document. It tells the browser which version of HTML the document is written in.

Doctype is the first line of the HTML document. It tells the browser which version of HTML the document is written in. The most common doctype is HTML5. It is important to have a doctype to ensure that the browser renders the page correctly. Without a doctype, the browser will use a default doctype, which may not be the one you want. This can lead to rendering issues, especially with CSS and JavaScript. So, always include a doctype at the top of your HTML document.

● **W3C Validity** W3C Validity is a tool that checks if your HTML code is valid according to the W3C standards.

W3C - World Wide Web Consortium. It is an international community that develops and maintains standards for the World Wide Web. The W3C standards ensure that web pages are consistent and interoperable across different browsers and devices. This helps to improve the user experience and makes it easier for developers to create web pages. The W3C standards are divided into three main categories: HTML, CSS, and XML. Each category has its own set of standards that developers must follow to ensure that their web pages are valid and compliant with the W3C standards.

✔ **Encoding** Encoding is the process of converting text into a format that can be stored and transmitted over the internet.

Encoding is the process of converting text into a format that can be stored and transmitted over the internet. The most common encoding is UTF-8. It is a variable-length character encoding that can represent any character in the Unicode standard. UTF-8 is widely supported by all major web browsers and is the default encoding for most web pages. It is important to use the correct encoding to ensure that your web pages are displayed correctly and that all characters are properly rendered. Without the correct encoding, some characters may appear as garbled text or may not be visible at all.
