What Is a VPN Kill Switch and How Does It Keep Your Data Safe?

📖 10 min read

When you use a VPN, your data is encrypted and sent through a secure tunnel to a VPN server. However, if the VPN connection drops, your data could be intercepted by hackers or your ISP. A VPN Kill Switch is a feature that automatically disconnects your device from the internet when the VPN connection drops, preventing your data from being exposed.

There are two main types of VPN Kill Switches: network-level and application-level. Network-level kill switches are implemented at the operating system level and affect all network traffic. Application-level kill switches are implemented within specific applications and only affect traffic from those applications.

Network-level kill switches are generally more effective than application-level kill switches because they prevent all network traffic from leaving your device when the VPN connection drops. However, they can also be more difficult to implement and may cause some applications to malfunction.

Application-level kill switches are easier to implement and can be more targeted, but they only protect traffic from the applications that have the kill switch enabled. If you have multiple applications installed, you may need to enable the kill switch for each one individually.

When choosing a VPN, it's important to look for one that offers a reliable Kill Switch feature. Some VPNs offer a "Kill Switch" button in their app, while others have it built into their operating system. Make sure to read the VPN's privacy policy to understand how the Kill Switch feature is implemented and whether it's truly effective.
